

# Assignment:

## Exploring AI for Women's Gender-Inclusion Programs

### Context

Umeed for Women works on women's inclusion and gender inclusion through a range of programs. During the guest session, two opportunities for scaling their work were discussed:

1. **Post-session support:**

Umeed conducts in-person sessions in colleges on gender inclusion, career readiness, and job readiness. Because these sessions involve personal and emotional conversations, the organization wants to retain the human, in-person interaction. However, they are exploring whether an AI-based follow-up mechanism could allow students to ask questions, discuss concerns, receive carefully controlled information and guidance, and, where appropriate, be connected back to Umeed for human support.

2. **Digital gender-inclusion game:**

Umeed has developed a card game that girls can play with their families to encourage conversations around gender roles, women's choices, careers, and participation in society. They are exploring whether the game can be digitized, with an AI-based facilitator/moderator that can guide the players, encourage discussion, and help facilitate the activity.

### Activity

Explore whether AI/LLMs can play a meaningful and responsible role in either of these two scenarios.

For **one** of the two problem cases, prepare a **two-page exploration report** addressing:

- **Problem & opportunity:** What is the underlying problem, and what could AI potentially help with?
- **Existing work:** Are there existing examples or research where LLMs/AI have been used for **emotionally sensitive, conversational, counselling-like, educational, or empathy-dependent interactions**?
- **Suitability of AI:** What aspects of the problem are appropriate for an AI system, and what aspects should remain human-led?
- **Risks & pitfalls:** What could go wrong? Consider issues such as inappropriate advice, emotional dependence, bias, privacy, safety, cultural context, hallucination, manipulation, and situations requiring human intervention.
- **Possible solution:** Propose a **high-level AI-enabled solution**, including how the AI and human/NGO roles could work together.
- **Your assessment:** Do you believe AI is appropriate for this problem? Why or why not?

**Important:** The objective is **not to build the solution**. The objective is to critically explore where AI could add value, where it should *not* be used, and what a responsible AI-human solution might look like.

**Deliverable:** Two-page report, supported by relevant examples/research where appropriate.
